

Does Institutional Outperform Retail? Performance Comparisons of Mutual Funds
Using Traditional Measures

Mehmet Sencicek

The BRC Academy Journal of Business 8, no. 1 (2018): 45–65.

WEB APPENDIX

<http://dx.doi.org/10.15239/j.brcacadjb.2018.08.01.wa03>

APPENDIX A. Tables for measures of fund performance and differences in measures.

The following tables show the Treynor Index (TI), Sharpe ratio (SR) and Jensen's "alpha" for each Morningstar classification and the differences between institutional and retail funds for each measure. The following symbols and abbreviations are used throughout the tables.

R(p)	: Average monthly return of the fund (portfolio)
Rf	: The risk-free rate, average yield on the 3-month treasury bill
Cov(pb)	: Covariance of the fund's risk premium with the benchmark's risk premium
Var(b)	: variance of the benchmark's risk premium
Beta	: Volatility of the fund's risk premium relative to the benchmark risk premium =Cov(pb)/Var(b)
Stdev (R(p))	: Volatility of the funds returns.
TI	: Treynor Index ;
	SR : Sharpe Ratio;
	Alpha : Jensen's alpha

Table 1. Measures for Large cap funds and differences in measures.

APPENDIX B. Morningstar style box and Russell indices

Morningstar's style classification allocates funds into different categories based on fund's investment methodology and the market capitalization of the companies in which it invests. It places the funds in large-cap, medium-cap or small-cap based on the market capitalization of the equities they hold. Funds are characterized as growth oriented, value oriented and blend. The combination of orientation and market capitalization yields nine categories: Large-Cap Growth, Mid-Cap Growth and Small-Cap Growth; Large-Cap value, Mid-Cap Value and Small-Cap Value; Large-Cap Blend, Mid-Cap Blend and Small-Cap Blend. A midcap value fund (X) would be categorized as shown in the box below.

Table B-1. Illustration of the Morningstar Style Box

Orientation	Market Cap (size)		
	Large	Midcap	Small
Value			
Blend	X		
Growth			

Table B-2. Fund classifications and appropriate benchmarks.

Fund Category	Relevant benchmark
Large-Cap Growth	Russell 1000 Growth index
Large-Cap Value	Russell 1000 Value Index
Large-Cap Blend	Russell 1000 index
Mid-Cap Growth	Russell 3000 Growth index
Mid-Cap Value	Russell 3000 Value index
Mid-Cap Blend	Russell 3000 index
Small Cap Growth	Russell 2000 Growth index
Small-Cap Value	Russell 2000 Value index
Small-Cap Blend	Russell 2000 index

APPENDIX C. Variables, symbols and detailed formulas

There are several variables used to assess risk in performance evaluation, the two most commonly used are beta and standard deviation. The beta for (the manager of) a fund (β_p) is the covariance of the fund's risk premium with the benchmark's risk premium divided by the variance of the benchmark's risk premium:

$$\beta_p = \frac{Cov(RP_{pt}, RP_{bt})}{Var(RP_{bt})} \quad \text{or}$$

$$\beta_p = \frac{\rho_{pb}}{\sigma_m^2}$$

$$\text{where } \rho_{pb} = \frac{Cov(RP_{pt}, RP_{bt})}{(\sigma(RP_{pt}))(\sigma(RP_{bt}))} \text{ and}$$

σ_m^2 is the market volatility.

where fund return observations are substituted for x and n is the sample size.

Treynor index:

$$TI = \frac{R_p - r_f}{\beta_p}$$

where,

R_p = the average rate of return for the portfolio during a specified time period;

r_f = the average rate of return for risk-free asset;

β_p = the slope of the portfolio's characteristic line during the same time period.

Sharpe ratio

$$S = \frac{R_p - r_f}{\sigma_p}$$

where

R_p = the average rate of return on the portfolio during a specified time period;

σ_p = the standard deviation on the portfolio;

r_f = the average rate of return on risk-free assets during the same time period; and

$(R_p - r_f)$ = the “risk premium”.

Standard deviation can be calculated readily through a software package or a program such as Microsoft

Excel, or by the following formula:

$$\sigma = \sqrt{\frac{n \sum x^2 - (\sum x)^2}{n(n-1)}}$$
